

Challenge (Habanero)

Open Ended Questions (FRQ)

Q9. Describe the transformation from the parent function $f(x) = x^2$ to the transformed function $g(x) = 3(x + 2)^2 - 1$. Provide the type of transformation and the effect on the graph.

Q10. Given the function $f(x) = 2^x$, graph the transformed function $g(x) = 2^{x-1} + 2$ on the same coordinate plane as the parent function. Label the transformations that occurred.

Chef's Tips

1

- Make sure to review the types of transformations with the class before the test.
- Emphasize the importance of labeling the transformations on the graph for the free response questions.
- Remind students to check their work and provide clear explanations for the free response questions.
