

Quiz (Habanero)

Open Ended Questions (FRQ)

Q9. A city's temperature is modeled by the equation $y = -$

$\frac{1}{2}x + 20$, where y is the temperature in $^{\circ}\text{C}$ and x is the time in hours. Find the rate of change of the temperature in $^{\circ}\text{C}/\text{hour}$ and explain what it means.

Q10. The water level in a lake is decreasing at a rate of 0.5 meters per year. Write an equation to model the water level in the lake over time and graph the equation. Explain what the slope of the graph means in the context of the lake's water level.

Chef's Tips

- Check for calculation errors and provide feedback.
- Emphasize the importance of interpreting slope in context.
- Encourage students to use graphs and tables to support their answers.
