

Homework (Jalapeno)

Open Ended Questions (FRQ)

Q9. A historian is studying the rise and fall of an ancient empire. The empire's population can be modeled by the equation $y = 2x - 5$, where y is the population in millions and x is the number of years since its founding. What is the rate of change of the population, and what does it represent in this context? Show your work and explain your answer.

Q10. A linear equation representing the cost of building a ancient structure is given by $y = \frac{1}{2}x + 10$, where y is the cost in dollars and x is the number of workers. If the structure requires 100 workers, what is the total cost, and what is the

Chef's Tips

- Tip 1: Remind students to show their work for FRQs
- Tip 2: Encourage students to use historical context to interpret slopes
- Tip 3: Emphasize the importance of labeling axes and units in graphs
