

Challenge (Habanero)

Open Ended Questions (FRQ)

- Q9.** A caterer records the amount of food x (in pounds) and the number of guests y for events. The data points are: (10, 20), (15, 30), (20, 40). Create a scatter plot and draw the best fit line. Make a prediction for the number of guests if 25 pounds of food are prepared.
- Q10.** A builder records the cost x (in dollars) and the area y (in square feet) for construction projects. If the best fit line equation is $y = 2x - 50$, and $x = 30$, predict the area and explain the meaning of the slope in this context.

Chef's Tips

1

- Tip 1: Ensure students understand the concept of correlation and how to identify it in a scatter plot.
- Tip 2: Emphasize the importance of using the equation of the best fit line to make predictions.
- Tip 3: Encourage students to interpret the slope and y-intercept in the context of the problem.
