

Homework (Habanero)

Open Ended Questions (FRQ)

Q9. A doctor prescribes a 0.75 mg dose of a medicine to be taken twice a day. If the patient takes the medicine for 10 days, what is the total dosage in milligrams? Show your work.

Q10. A patient's temperature is 37.2°C at 8 am. At 12 pm, the patient's temperature rises to 38.5°C . What is the percentage increase in temperature? Use the formula: $\left(\frac{\text{New Value} - \text{Old Value}}{\text{Old Value}}\right) \cdot 100$

Chef's Tips

- For questions 1-8, select the best answer from the given choices.
- For questions 9-10, make sure to show all work and calculations.
- No explanations or justifications are required for multiple-choice questions.
