

Homework 2

Q1. What is the variable in the expression $2x + 3$?

- (A) 2
- (B) 3
- (C) x
- (D) $2x$
- (E) None of the above

Q2. Identify the coefficient in the term $4y$

- (A) y
- (B) 4
- (C) $4y$
- (D) None of the above
- (E) 0

Q3. What is the constant term in the expression $x + 2$?

- (A) x
- (B) 2
- (C) $x + 2$
- (D) None of the above
- (E) 0

Q4. Identify the operator in $5 - 2$

- (A) 5
- (B) 2
- (C) -
- (D) None of the above
- (E) +

Q5. What is the term $3x$ an example of?

- (A) Constant
- (B) Variable
- (C) Coefficient times a variable
- (D) Expression
- (E) Equation

Q6. In the expression $2x + 5$, what operation is performed first?

- (A) Addition
- (B) Multiplication
- (C) Subtraction
- (D) Division
- (E) None of the above

Q7. What does the expression $2(x + 3)$ mean?

- (A) 2 times x plus 3
- (B) 2 times the sum of x and 3
- (C) x plus 3 times 2
- (D) x plus 2 times 3
- (E) $2x + 6$

Q8. Identify the expression $x - 2$ as an example of?

- (A) A single term
- (B) A constant
- (C) A single-variable expression
- (D) A multi-variable expression
- (E) An equation

Open Ended Questions (FRQ)

Q9. Explain, using examples, the difference between a variable and a constant in an algebraic expression. Provide a simple expression that includes both.

Q10. Draw a simple diagram to illustrate the concept of the order of operations. Use the expression $3 \times 2 + 12 \div 4$ as an example and explain each step.

Chef's Tips

- Focus on defining key terms such as 'variable', 'constant', and 'coefficient' to ensure students have a solid foundation.
- Use simple expressions to illustrate the order of operations, emphasizing the sequence of steps to follow.
- Encourage students to use diagrams or visual aids to help them understand and explain complex concepts in a simple manner.
